### The Effects of Education on Wealth Inequality over the Life Cycle [PDF]

**Summary:** This study explores the causal link between education and wealth accumulation, using three identification methods and a two-generation U.S. panel dataset. It finds that higher education, especially college and postgraduate levels, significantly increases lifetime wealth. A life-cycle model assesses educational policies' effects on wealth, suggesting that more college graduates could reduce wealth inequality. This research highlights education's role in wealth generation and distribution.
